

#1

- for (int i=0; $i \leq n$; i++) miscount 3-次 operation.
- $i \leq n$ 中会执行多1次 (其它 condition 也一样, +1 就对了), 因为最后一次 false comparison 也算.

Week 2 Twt — Analysis of algorithm Q1.

#2.

- 不知道怎么找 int arr 的 size, 尤其是传进 function 后.
- Array size 从建 array 时就应该知道 (不然怎么创?), 或者这样时你要手动算:

```
int arr[] = {10, 20, 30};
```

```
int size = sizeof(arr) / sizeof(arr[0])
```

但也是在传进 function 前算, 不然传进 fn, arr 就只是个 pointer, 就不能用上面的公式了.

Week 2 Twt — Analysis of algorithm Q2.

#3

- 每次传 arr 进 function 要把 size 带上, 不然 fn 不知道 arr size

Week 2 Twt — Analysis of algorithm Q2.

#4

- Time complexity 的 definition 很重要, 不然会 related question 做懵逼
- The amount of time/operations that an algorithm takes to run with various size of input, represented by

function relation

Lec 1.2 - Appendix Q Pt 1.

#5.

- Good practice question to understand time complexity.

Lec 1.2 - Appendix Q Pt 1.

#6.

- The dominant term of $n^2(3+\log n)$ is $n^2 \log n$, not n^2
- It's still about who grows faster, but n^2 is growing slower than $n^2 \log n$

Week 2 Quiz Q4.

#7

- Good practice for understand process of binary search

Week 2 Quiz Q6.
